*** CS 106B MIDTERM REFERENCE SHEET ***

You can perform a for-each loop over any collection other than Stack and Queue. for (type name: collection) { ... }

Vector<T> Members ("vector.h") (5.1)

<pre>v.add(value); or v += value;</pre>	appends to end of vector	O(1)
<pre>v.clear();</pre>	removes all elements	O(1)
<pre>v.get(index) or v[index]</pre>	returns value at given index	O(1)
<pre>v.insert(index, value);</pre>	inserts at given index, shifting subsequent values right	O(N)
<pre>v.isEmpty()</pre>	returns true if there are no elements	O(1)
<pre>v.remove(index);</pre>	removes value at given index, shifting subsequent values left	O(N)
<pre>v.set(index, value); or</pre>	replaces value at given index	O(1)
ν[index] = value;		
v.size()	returns number of elements	O(1)
<pre>v.toString()</pre>	returns string representation of elements such as "{1, 2, 3}"	O(N)

Grid<T> Members ("grid.h") (5.1)

<pre>g.fill(value);</pre>	set every cell to store a given value	O(R*C)
<pre>g.get(row, col) or g[row, col]</pre>	returns value stored at given row/column	O(1)
<pre>g.inBounds(row, col)</pre>	returns true if given row/column index is within (0, 0) (R, C)	O(1)
<pre>g.numCols() // or g.width()</pre>	returns number of columns C	O(1)
<pre>g.numRows() // or g.height()</pre>	returns number of rows R	O(1)
<pre>g.resize(nCols, nRows);</pre>	changes grid to have the given number of rows/columns; wipes all data	O(R*C)
<pre>g.set(row, col, value); or</pre>	changes value stored at given row/column	O(1)
g[row][col] = value;		

Stack<T> Members ("stack.h") (5.2)

Queue<T> Members ("queue.h") (5.3)

<pre>s.clear();</pre>	removes all elements	<pre>q.clear();</pre>	removes all elements	O(N)
<pre>s.push(value);</pre>	adds given value on top of the stack	<pre>q.enqueue(value);</pre>	adds value to back of queue	O(1)
s.pop()	remove/return top value from stack;	<pre>q.dequeue()</pre>	remove/return value from front;	O(1)
	pop/peek throw exception if empty		dequeue/peek throw if empty	
<pre>s.peek()</pre>	return top value without removing	<pre>q.peek()</pre>	return front without removing	O(1)
<pre>s.isEmpty()</pre>	returns true if there are no elements	<pre>q.isEmpty()</pre>	returns true if no elements	O(1)
s.size()	returns number of elements	<pre>q.size()</pre>	returns number of elements	O(1)
<pre>s.toString()</pre>	string (right=top) such as "{1, 2, 3}"	<pre>q.toString()</pre>	(left=front) e.g. "{1, 2, 3}"	O(N)

Set<T> and HashSet<T> Members ("set.h", "hashset.h") (5.5)

<pre>s.add(value); or s += value;</pre>	adds to set; if a duplicate, no effect	set O(log N), hash O(1)
<pre>s.clear();</pre>	removes all elements	O(N)
<pre>s.contains(value)</pre>	returns true if value is found in the set	set O(log N), hash O(1)
<pre>s.isEmpty()</pre>	returns true if there are no elements	O(1)
<pre>s.isSubsetOf(s2)</pre>	returns true if s2 contains all elements of s	O(N)
<pre>s.remove(value); or s -= value;</pre>	removes value from set, if present	set O(log N), hash O(1)
s.size()	returns number of elements	O(1)
<pre>s.toString()</pre>	returns string such as "{1, 2, 3}"	O(N)
s1 == s2, s1 != s2	operators for set equality testing	O(N)
s1 + s2, s1 += s2;	operators for union; adds elements of 52 to 51	O(N)
s1 * s2, s1 *= s2;	intersection; removes all from s1 not found in s2	O(N)
s1 - s2, s1 -= s2;	difference; removes all from 51 that are found in 52	O(N)

Lexicon Members ("lexicon.h") (5.5)

<pre>L.add(word);</pre>	adds a word; if a duplicate, no effect	O(log N)
<pre>l.clear();</pre>	removes all words	O(N)
<pre>L.contains(word)</pre>	returns true if the word is found in the lexicon	O(log N)
<pre>l.containsPrefix(text)</pre>	returns true if any word starts with this prefix text	O(log N)
<pre>L.isEmpty()</pre>	returns true if there are no words in the lexicon	O(1)
<pre>L.remove(word);</pre>	removes word from lexicon, if present	O(log N)
L.size()	returns number of words	O(1)
<pre>s.toString()</pre>	returns string such as "{a, ball, cat, zebra}"	O(N log N)

*** CS 106B MIDTERM REFERENCE SHEET ***

Map<K, V> and HashMap<K, V> Members ("map.h", "hashmap.h") (5.4)

<pre>m.clear();</pre>	removes all key/value pairs	O(N)
<pre>m.containsKey(key)</pre>	returns true if map contains a pair for the given key	map O(log N), hash O(1)
<pre>m.get(key) or</pre>	returns value paired with the given key	map O(log N), hash O(1)
m[key]	(a default value if the key is not present)	
<pre>m.isEmpty()</pre>	returns true if there are no key/value pairs	O(1)
<pre>m.keys()</pre>	returns a Vector copy of all keys in the map	O(N)
<pre>m.put(key, value) or</pre>	adds a pairing of the given key to the given value	map O(log N), hash O(1)
<pre>m[key] = value;</pre>		
<pre>m.remove(key);</pre>	removes any existing pairing for the given key	map O(log N), hash O(1)
<pre>m.size()</pre>	returns number of key/value pairs	O(1)
<pre>m.toString()</pre>	returns string representation such as "{a:90, d:60, c:70}"	O(N)
<pre>m.values()</pre>	returns a Vector copy of all values in the map	O(N)

A for-each loop on a map iterates over the keys, not the values.

String Members and Utility Functions (<string>, "strlib.h") (3.2)

str.rfind(str)appears in this string (string::npos if not found)str.insert(index, str);add text into a string at a given index (in-place)str.length() or str.size()number of characters in this stringstr.replace(index, len, str);replaces len chars at given index with new text (in-place)str.substr(start, length) orreturns the next length characters beginning at index start (inclusive);str.substr(start)if length is omitted, grabs from start to the end of the stringendsWith(str, suffix)returns true if the string begins or ends with the given prefix/suffixstartsWith(str, prefix)returns a conversion between numbers and stringsintegerToString(double), stringToReal(str)returns a conversion between numbers and stringsequalsIgnoreCase(str1, str2)true if s1 and s2 have same chars, ignoring casingstringSplit(str, separator)breaks apart a string into a vector of smaller strings based on a separator		-
str.c_str()returns the equivalent C stringstr.compare(str)return -1, 0, or 1 depending on relative orderingstr.erase(index, length);delete text from a string starting at given index (in-place)str.find(str)returns the first or last index where the start of the given string or characterstr.insert(index, str);add text into a string at a given index (in-place)str.length() or str.size()number of characters in this stringstr.replace(index, len, str);replaces len chars at given index with new text (in-place)str.substr(start, length) orreturns the next length characters beginning at index start (inclusive);str.substr(start)if length is omitted, grabs from start to the end of the stringendsWith(str, suffix)returns true if the string begins or ends with the given prefix/suffixstartsWith(str, prefix)returns a conversion between numbers and stringsintegerToString(int), stringToInteger(str)returns a conversion between numbers and stringsrealToString(double), stringToReal(str)returns a conversion between numbers and stringsequalsIgnoreCase(str1, str2)true if s1 and s2 have same chars, ignoring casingstringSplit(str, separator)breaks apart a string into a vector of smaller strings based on a separator	<pre>str.at(index) or s[index]</pre>	character at a given 0-based index in the string
str.compare(str)return -1, 0, or 1 depending on relative orderingstr.erase(index, length);delete text from a string starting at given index (in-place)str.find(str)returns the first or last index where the start of the given string or character appears in this string (string::npos if not found)str.insert(index, str);add text into a string at a given index (in-place)str.length() or str.size()number of characters in this stringstr.replace(index, len, str);replaces len chars at given index with new text (in-place)str.substr(start, length) orreturns the next length characters beginning at index start (inclusive);str.substr(start)if length is omitted, grabs from start to the end of the stringendsWith(str, suffix)returns true if the string begins or ends with the given prefix/suffixstartsWith(str, prefix)returns a conversion between numbers and stringsintegerToString(int), stringToInteger(str)returns a conversion between numbers and stringsrealToString(double), stringToReal(str)true if s1 and s2 have same chars, ignoring casingstringSplit(str, separator)breaks apart a string into a vector of smaller strings based on a separator	<pre>str.append(str);</pre>	add text to the end of a string (in-place)
str.erase(index, length);delete text from a string starting at given index (in-place)str.find(str)returns the first or last index where the start of the given string or character appears in this string (string::npos if not found)str.insert(index, str);add text into a string at a given index (in-place)str.length() or str.size()number of characters in this stringstr.replace(index, len, str);replaces len chars at given index with new text (in-place)str.substr(start, length) orreturns the next length characters beginning at index start (inclusive);str.substr(start)if length is omitted, grabs from start to the end of the stringendsWith(str, suffix)returns true if the string begins or ends with the given prefix/suffixstartsWith(str, prefix)returns a conversion between numbers and stringsintegerToString(double), stringToInteger(str)returns a conversion between numbers and stringsrealToString(double), stringToReal(str)true if s1 and s2 have same chars, ignoring casingstringSplit(str, separator)breaks apart a string into a vector of smaller strings based on a separator	<pre>str.c_str()</pre>	returns the equivalent C string
str.find(str)returns the first or last index where the start of the given string or character appears in this string (string::npos if not found)str.insert(index, str);add text into a string at a given index (in-place)str.length() or str.size()number of characters in this stringstr.replace(index, Len, str);replaces Len chars at given index with new text (in-place)str.substr(start, Length) orreturns the next Length characters beginning at index start (inclusive);str.substr(start)if Length is omitted, grabs from start to the end of the stringendsWith(str, suffix)returns true if the string begins or ends with the given prefix/suffixstartsWith(str, prefix)returns a conversion between numbers and stringsintegerToString(int), stringToInteger(str)returns a conversion between numbers and stringsrealToString(double), stringToReal(str)true if s1 and s2 have same chars, ignoring casingstringSplit(str, separator)breaks apart a string into a vector of smaller strings based on a separator	<pre>str.compare(str)</pre>	return -1, 0, or 1 depending on relative ordering
str.rfind(str)appears in this string (string::npos if not found)str.insert(index, str);add text into a string at a given index (in-place)str.length() or str.size()number of characters in this stringstr.replace(index, len, str);replaces len chars at given index with new text (in-place)str.substr(start, length) orreturns the next length characters beginning at index start (inclusive);str.substr(start)if length is omitted, grabs from start to the end of the stringendsWith(str, suffix)returns true if the string begins or ends with the given prefix/suffixstartsWith(str, prefix)returns a conversion between numbers and stringsintegerToString(double), stringToReal(str)returns a conversion between numbers and stringsequalsIgnoreCase(str1, str2)true if s1 and s2 have same chars, ignoring casingstringSplit(str, separator)breaks apart a string into a vector of smaller strings based on a separator	<pre>str.erase(index, length);</pre>	delete text from a string starting at given index (in-place)
str.insert(index, str);add text into a string at a given index (in-place)str.length() or str.size()number of characters in this stringstr.replace(index, len, str);replaces len chars at given index with new text (in-place)str.substr(start, length) orreturns the next length characters beginning at index start (inclusive);str.substr(start)if length is omitted, grabs from start to the end of the stringendsWith(str, suffix)returns true if the string begins or ends with the given prefix/suffixstartsWith(str, prefix)returns a conversion between numbers and stringsintegerToString(double), stringToReal(str)returns a conversion between numbers and stringsequalsIgnoreCase(str1, str2)true if s1 and s2 have same chars, ignoring casingstringSplit(str, separator)breaks apart a string into a vector of smaller strings based on a separator		returns the first or last index where the start of the given string or character
str.length() or str.size()number of characters in this stringstr.replace(index, len, str);replaces len chars at given index with new text (in-place)str.substr(start, length) orreturns the next length characters beginning at index start (inclusive);str.substr(start)if length is omitted, grabs from start to the end of the stringendsWith(str, suffix)returns true if the string begins or ends with the given prefix/suffixstartsWith(str, prefix)returns a conversion between numbers and stringsintegerToString(double), stringToReal(str)returns a conversion between numbers and stringsrealToString(double), stringToReal(str)true if s1 and s2 have same chars, ignoring casingstringSplit(str, separator)breaks apart a string into a vector of smaller strings based on a separator	<pre>str.rfind(str)</pre>	appears in this string (string::npos if not found)
str.replace(index, len, str);replaces len chars at given index with new text (in-place)str.substr(start, length) orreturns the next length characters beginning at index start (inclusive);str.substr(start)if length is omitted, grabs from start to the end of the stringendsWith(str, suffix)returns true if the string begins or ends with the given prefix/suffixstartsWith(str, prefix)returns a conversion between numbers and stringsintegerToString(int), stringToInteger(str)returns a conversion between numbers and stringsrealToString(double), stringToReal(str)true if s1 and s2 have same chars, ignoring casingstringSplit(str, separator)breaks apart a string into a vector of smaller strings based on a separator	<pre>str.insert(index, str);</pre>	add text into a string at a given index (in-place)
str.substr(start, length)orreturns the next length characters beginning at index start (inclusive);str.substr(start)if length is omitted, grabs from start to the end of the stringendsWith(str, suffix)returns true if the string begins or ends with the given prefix/suffixstartsWith(str, prefix)returns true if the string begins or ends with the given prefix/suffixintegerToString(int), stringToInteger(str)returns a conversion between numbers and stringsrealToString(double), stringToReal(str)true if s1 and s2 have same chars, ignoring casingstringSplit(str, separator)breaks apart a string into a vector of smaller strings based on a separator	<pre>str.length() or str.size()</pre>	number of characters in this string
str.substr(start)if Length is omitted, grabs from start to the end of the stringendsWith(str, suffix)returns true if the string begins or ends with the given prefix/suffixstartsWith(str, prefix)returns true if the string begins or ends with the given prefix/suffixintegerToString(int), stringToInteger(str)returns a conversion between numbers and stringsrealToString(double), stringToReal(str)true if s1 and s2 have same chars, ignoring casingstringSplit(str, separator)breaks apart a string into a vector of smaller strings based on a separator	<pre>str.replace(index, len, str);</pre>	replaces <i>Len</i> chars at given index with new text (in-place)
endsWith(str, suffix) startsWith(str, prefix) integerToString(int), stringToInteger(str) realToString(double), stringToReal(str) equalsIgnoreCase(str1, str2) stringSplit(str, separator) returns true if the string begins or ends with the given prefix/suffix returns a conversion between numbers and strings true if s1 and s2 have same chars, ignoring casing breaks apart a string into a vector of smaller strings based on a separator	<pre>str.substr(start, length) or</pre>	returns the next Length characters beginning at index start (inclusive);
startsWith(str, prefix) integerToString(int), stringToInteger(str) realToString(double), stringToReal(str) equalsIgnoreCase(str1, str2) stringSplit(str, separator) returns a conversion between numbers and strings true if s1 and s2 have same chars, ignoring casing breaks apart a string into a vector of smaller strings based on a separator	<pre>str.substr(start)</pre>	if Length is omitted, grabs from start to the end of the string
integerToString(int), stringToInteger(str) realToString(double), stringToReal(str) equalsIgnoreCase(str1, str2) stringSplit(str, separator) returns a conversion between numbers and strings true if s1 and s2 have same chars, ignoring casing breaks apart a string into a vector of smaller strings based on a separator		returns true if the string begins or ends with the given prefix/suffix
realToString(double), stringToReal(str) equalsIgnoreCase(str1, str2) true if s1 and s2 have same chars, ignoring casing stringSplit(str, separator) breaks apart a string into a vector of smaller strings based on a separator	<pre>startsWith(str, prefix)</pre>	
equalsIgnoreCase(str1, str2) true if s1 and s2 have same chars, ignoring casing stringSplit(str, separator) breaks apart a string into a vector of smaller strings based on a separator		returns a conversion between numbers and strings
stringSplit(str, separator) breaks apart a string into a vector of smaller strings based on a separator	realToString(<i>double</i>), stringToReal(<i>str</i>)	
	equalsIgnoreCase(<i>str1</i> , <i>str2</i>)	true if s1 and s2 have same chars, ignoring casing
toLowerCase(str), toUpperCase(str) returns an upper/lowercase version of a string	stringSplit(<i>str</i> , <i>separator</i>)	breaks apart a string into a vector of smaller strings based on a separator
	toLowerCase(<i>str</i>), toUpperCase(<i>str</i>)	returns an upper/lowercase version of a string
trim(str) returns string with any surrounding whitespace removed	trim(str)	returns string with any surrounding whitespace removed

char Utility Functions (<cctype>) (3.3)

isalpha(c), $isdigit(c)$, $isspace(c)$,	returns true if the given character is an alphabetic character from a-z or A-Z, a digit
isupper(c), $ispunct(c)$, $islower(c)$	from 0-9, an alphanumeric character (a-z, A-Z, or 0-9), an uppercase letter (A-Z), a
	space character (space, \t, \n, etc.), respectively
tolower(c), toupper(c)	returns lower/uppercase equivalent of a character

istream Members (<iostream>) (Ch. 4)

<pre>f.fail()</pre>	returns true if the last read call failed (e.g. EOF)
<pre>f.open(filename);</pre>	opens file represented by given string
<pre>f.close();</pre>	stops reading file
<pre>f.get()</pre>	reads and returns 1 character
getline(f %, str %)	reads line of input into a string by reference;
	returns a true/false indicator of success
f >> variable	reads a whitespace-separated token of data from input into a variable

Random Numbers ("random.h")

randomBool()	returns a random bool of true/false with 50/50% probability
<pre>randomChance(probability)</pre>	returns a random bool of true/false with the given probability of true from 01
<pre>randomInteger(min, max)</pre>	returns a random integer in the range [min-max], inclusive
randomReal(<i>low</i> , <i>high</i>)	returns a random real number in the range [low-high], up to but not including high
